

LECTURE 05

IMAGE RESTORATION

ពិនិត្យរាងការ, រៀបចំរាងការ Corrupt

Punnarai Siricharoen, Ph.D.

OBJECTIVES

- To understand different types of image degradations ପ୍ରକଳପିତାଙ୍କର କମ୍ପ୍ୟୁଟର ପାଠ୍ୟ ଗ୍ରହଣ କରିବାର ଜ୍ଞାନ
- To understand and be able to apply image restoration techniques for different types of degradations properly

CONTENT

- Image degradations
- Image restoration

IMAGE RESTORATION

Concerns the removal or reduction of degradations that have occurred during the acquisition of the image.

Degradations: noise (errors in pixel values), optical effects (out-of-focus blurring or blurring due to camera motion).

↳ effect known convolution

Neighborhood operations or frequency domain

IMAGE RESTORATION

- Image restoration attempts to reconstruct or recover an image that has been degraded by using prior knowledge of the degradation phenomenon.
- Image degradation / restoration process is modeled as degradation function $h(x,y)$ that, together with an additive noise term $\eta(x,y)$, operates on an input image $f(x,y)$. The degraded image $g(x,y)$ in spatial domain is given by

$$g(x,y) = h(x,y) * f(x,y) + \eta(x,y) \quad \text{degraded image} = \text{original image} \downarrow \text{degradation}$$

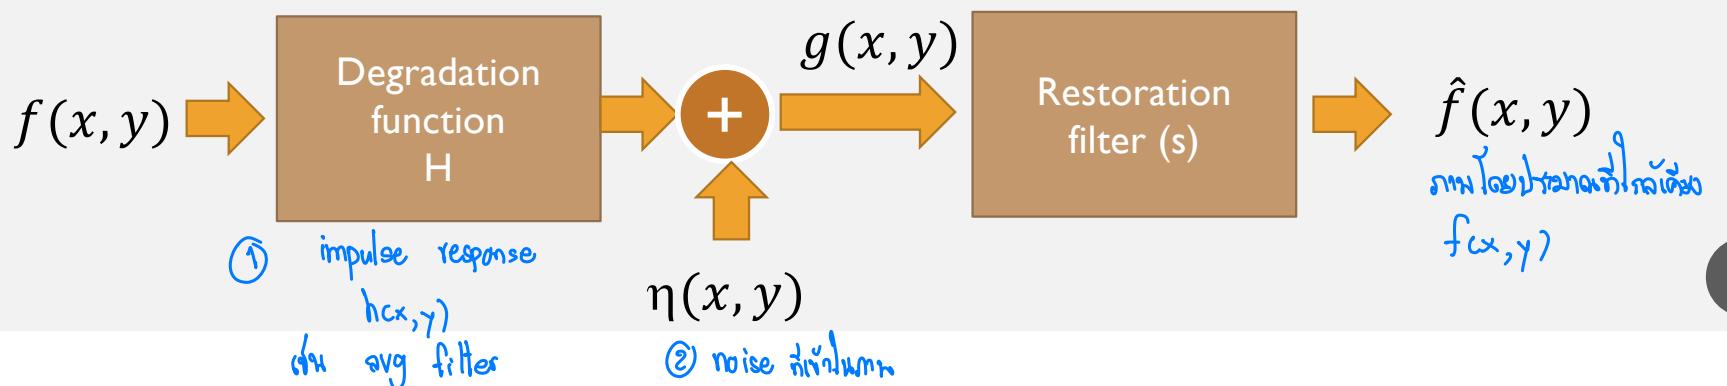

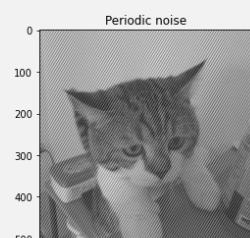

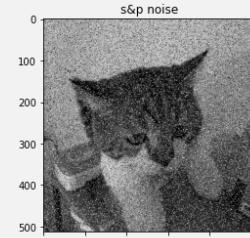

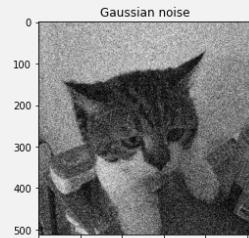

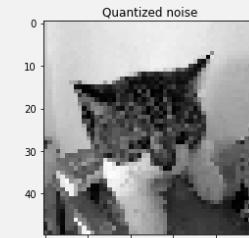

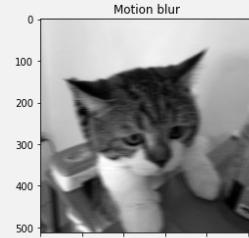

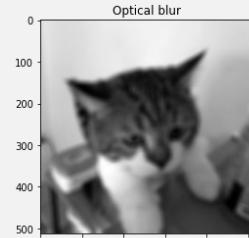

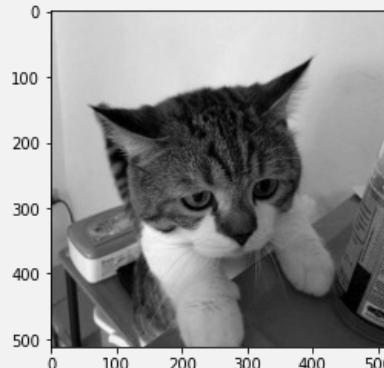

IMAGE DEGRADATIONS

$$g(x,y) = h(x,y) * f(x,y) + \eta(x,y) \rightarrow \text{spatial}$$

- The $*$ convolution in spatial domain is equivalent to multiplication in frequency domain representation below,

$$G(u, v) = H(u, v)F(u, v) + N(u, v) \quad \text{frequency domain}$$

- Degradations:

NOISE

Not this
noise

- Considering a noisy image $g(x,y)$ formed by the addition of noise $\eta(x,y)$ to an original image:

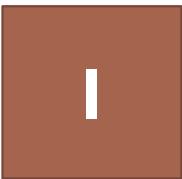

$$g(x, y) = f(x, y) + \eta(x, y)$$

ឧបករណីទៅការស្នូលាង cable , ទោរយុទ្ធសាស្ត្រ

- Noise: any degradation caused by external disturbance. E.g., image sent from one place to another via Satellite or wireless transmission, network cables
- Cleaning an image for image restoration.

NOISE

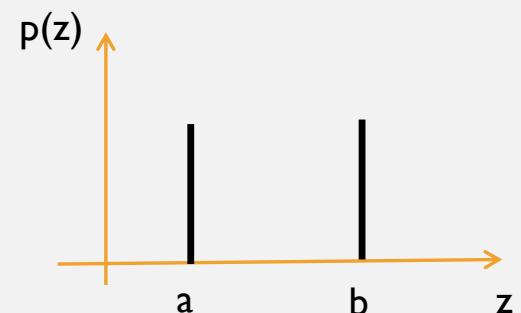

- Various types of noise and how they appear on an image:
 - Salt and Pepper noise
 - Gaussian noise
 - Speckle noise
 - Periodic noise

NOISE: SALT & PEPPER

- Impulse noise, shot noise or binary noise.
- Resemble salt-and-pepper granules randomly distributed over the image.
- Probability density function (PDF) of the impulse noise is given by

$$p(z) = \begin{cases} P_a & \text{for } z = a \\ P_b & \text{for } z = b \\ 0 & \text{otherwise} \end{cases}$$

where z – gray level, if $b>a$ b will appear as a light dot in the image, a is a dark dot.
 a and b are saturated values.

I

NOISE: SALT & PEPPER

- During image digitizing process, impulse corruption is usually large compared with the strength of the image signal. So it is digitized to black or white values in an image. បានជាបិទចំណាំ Quantization និង Energy ក្រោមភាព interrupt
អ្នក នូវ sensor ខាង
- **Impulse noise** is found in situations where quick transients such as faulty switching take place during imaging. ពីរករ switching ឱ្យរាយ
- What do you think what is a and b could be for 8 bit image?

I

NOISE: SALT & PEPPER

- Python: 1) generate a grayscale image from a color image.
- 2) To add noise use `skimage.util import random_noise` as follows:

```
import cv2
from skimage.util import random_noise

img = cv2.imread("twins.jpg", 0)
sp = random_noise(img, mode='s&p')      5%
sp2 = random_noise(img, mode='s&p', amount = 0.2)    Random noise
```

where amount is the noise density (default:0.05)

`amount` : float, optional

Proportion of image pixels to replace with noise on range [0, 1]. Used in 'salt', 'pepper', and 'salt & pepper'. Default : 0.05

https://scikit-image.org/docs/dev/api/skimage.util.html#skimage.util.random_noise

random_noise

`skimage.util.random_noise(image, mode='gaussian', seed=None, clip=True, **kwargs)` [\[source\]](#)

Function to add random noise of various types to a floating-point image.

Parameters

`image` : ndarray

Input image data. Will be converted to float.

`mode` : str, optional

One of the following strings, selecting the type of noise to add:

- 'gaussian' Gaussian-distributed additive noise.
- 'localvar' Gaussian-distributed additive noise, with specified local variance at each point of `image`.
- 'poisson' Poisson-distributed noise generated from the data.
- 'salt' Replaces random pixels with 1.
- 'pepper' Replaces random pixels with 0 (for unsigned images) or -1 (for signed images).
- 's&p' Replaces random pixels with either 1 or `low_val`, where `low_val` is 0 for unsigned images or -1 for signed images.
- 'speckle' Multiplicative noise using `out = image + n*image`, where `n` is uniform noise with specified mean & variance.

2

NOISE: SALT & PEPPER

```
import matplotlib.pyplot as plt
fig = plt.figure(figsize = (16,8))
fig.add_subplot(1,3,1), plt.imshow(img, cmap="gray"), plt.title('Original')
fig.add_subplot(1,3,2), plt.imshow(sp, cmap="gray"), plt.title('Salt & Pepper')
fig.add_subplot(1,3,3), plt.imshow(sp2, cmap="gray"), plt.title('Salt & Pepper (noise
density = 0.2)')
plt.show()
```

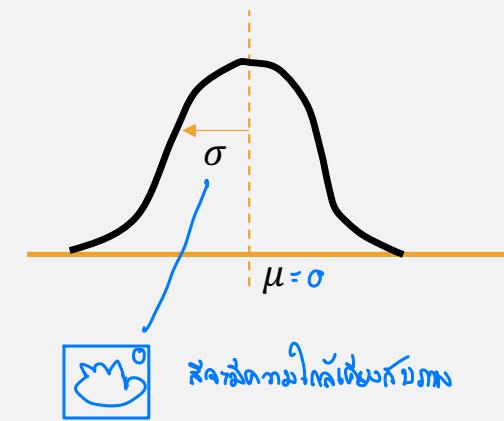

2

NOISE: GAUSSIAN NOISE

- Gaussian also called, 'Normal'.
- Idealized form of white noise which is caused by random fluctuations of the signal.
- Noise is normally distributed.

$$p(z) = \frac{1}{\sqrt{2\pi}\sigma} e^{-(z-\mu)^2/2\sigma^2}$$

- z represents gray level, μ is the mean of z and σ is its standard deviation.

2

NOISE: GAUSSIAN NOISE

- Adds Gaussian white noise of mean m and variance v to the image img. The default is zero mean noise with 0.01 variance

```
gauss2 = random_noise(img, mode='gaussian', var = VAR , mean=MEAN)
```

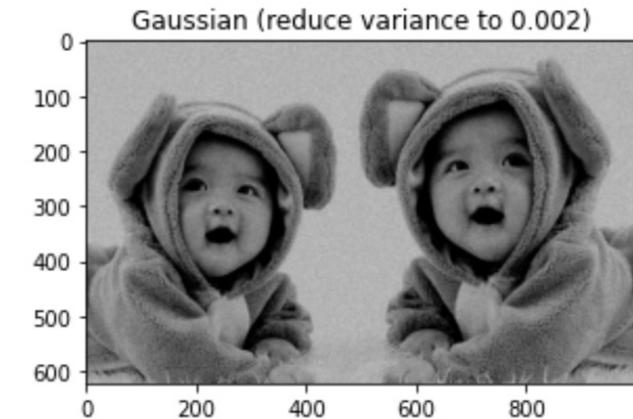

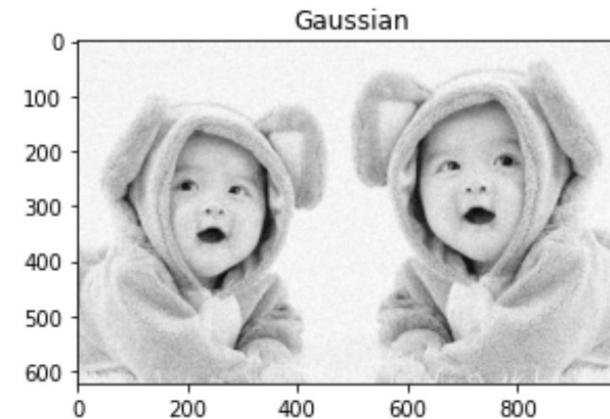

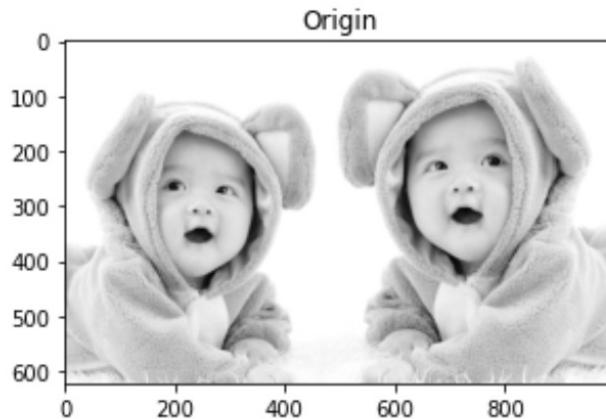

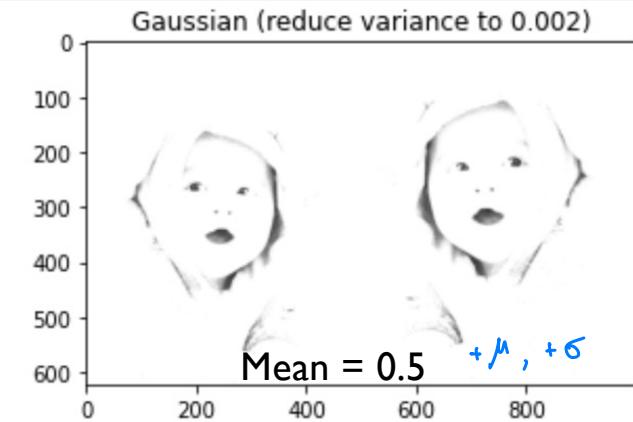

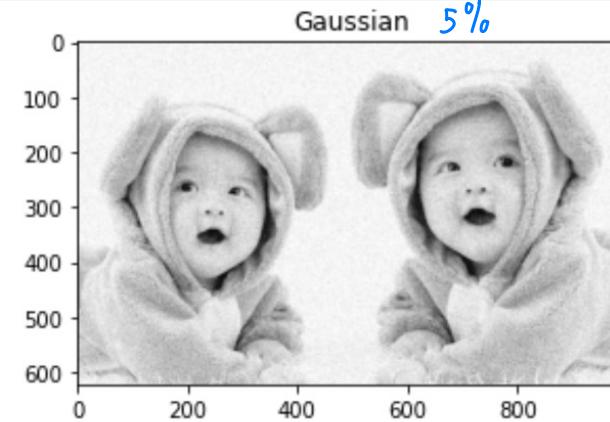

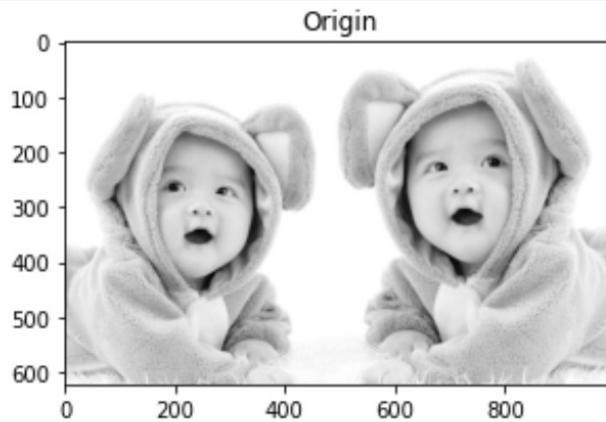

```
gauss = random_noise(img, mode='gaussian')
```

```
gauss2 = random_noise(img, mode='gaussian', var = 0.002, mean=0.5)
```

```
import matplotlib.pyplot as plt
fig = plt.figure(figsize = (16,8))
fig.add_subplot(1,3,1), plt.imshow(img, cmap="gray"), plt.title('Origin')
fig.add_subplot(1,3,2), plt.imshow(gauss, cmap="gray"), plt.title('Gaussian')
fig.add_subplot(1,3,3), plt.imshow(gauss2, cmap="gray"),
plt.title('Gaussian (reduce variance to 0.002)')
plt.show()
```

2

NOISE: GAUSSIAN NOISE

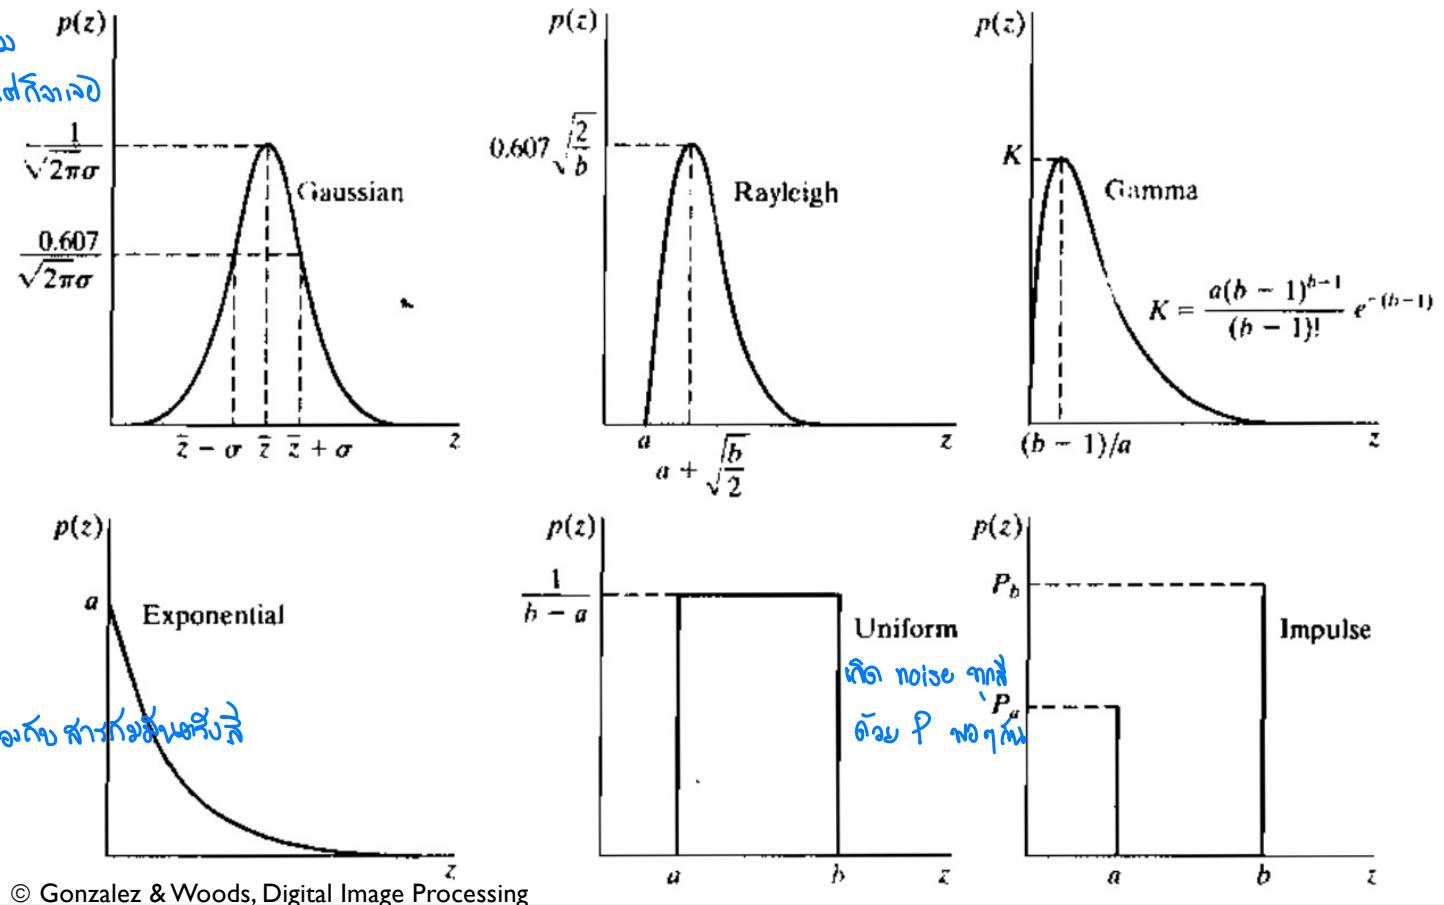

Making the mean of the noise to the dark values

Default mean = 0, var = 0.01

Mean = -0.5

NOISE: PROBABILITY DENSITY FUNCTIONS FOR NOISE

- Gaussian noise *ຕົກລົງຄວາມຄະດີ້ນ ຕົວ ISO ແກ່ສຳລັບ*
 - Most frequently in practice
 - Electronic circuit noise *Gaussian*
 - Sensor noise from poor illumination
- Rayleigh noise
 - Medical imaging, such as X-rays & MRI
- Exponential & Gamma
 - Laser imaging
- Exponential – PET/SPECT *ເກີນກ່ອງລົງສໍາກັດສິນເຊີນເຊື້ອ*
- Uniform – dust in a camera lens *ຝຶພູນເຄົາສົ່ວ*

3

NOISE: SPECKLE NOISE

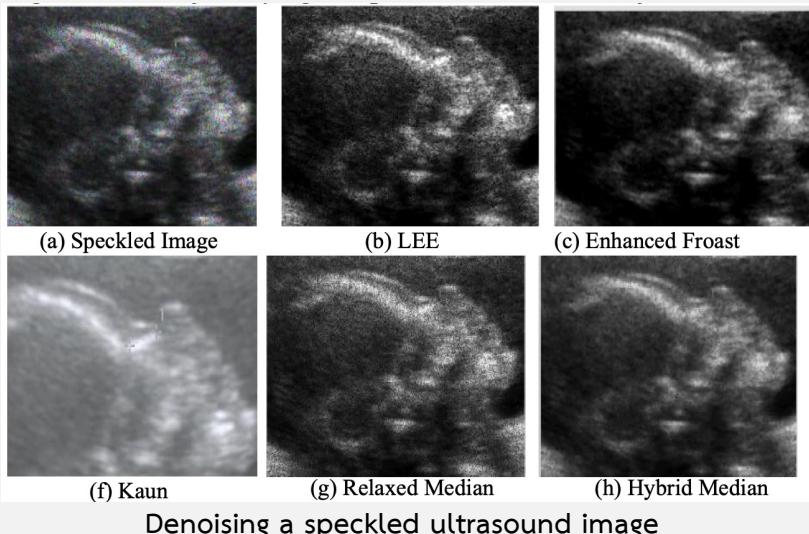

extreme noise

- Can be modeled by random values multiplied by pixel values -> **multiplicative noise.** $f(x,y) +$
$$g(x,y) = f(x,y) * n(x,y)$$
- $g(x,y)$ – distorted image, $f(x,y)$ – original image, $n(x,y)$ – speckle noise
- The major problem in some laser, radar applications and ultrasound imaging
 - Ultrasound imaging – granular patterns in an image due to wave interference by adding up or canceling *கல்வீச் சுருள் (interference)*
 - Synthetic Aperture Radar (SAR) - radar waves hit the surface, they scatter in different directions and results in a granular patterns

3

NOISE: SPECKLE NOISE

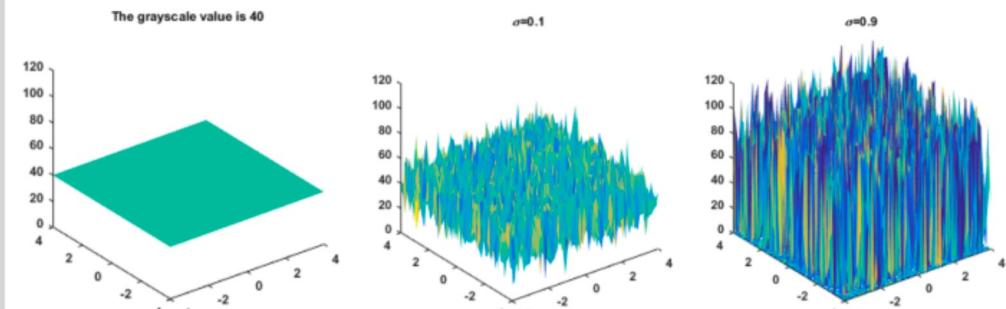

- The influence of the speckle noise, the effects of speckle noise with variances of 0.1 and 0.9 on an image is shown below. The larger the variance of the speckle noise is, the more difficult it is to recover [Ren et al., 2019]

Denoising a speckled ultrasound image

B.Priestly Shan and M.Madheswaran, A Generalized Despeckling Filter for Enhancing Fetal Structures to Aid Automated Obstetric Pathologies

Figure 1

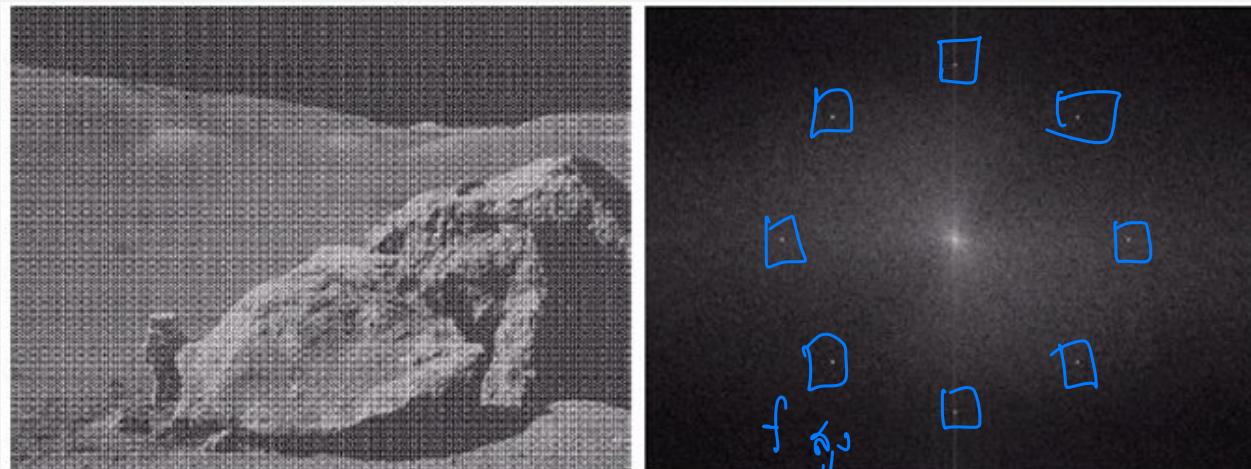

The effects of speckle noise with variances of 0.1 and 0.9 on image gray values.

https://www.poroussilicon.com/uploads/2/9/7/0/29708759/9541123_orig.png

4

NOISE: PERIODIC NOISE

- **Periodic Noise** – electrical or electromagnetical interference during image acquisition. *ஒளித்தொடர் sampling*
- Can be reduced significantly via frequency domain filtering.

a b

FIGURE 5.5
(a) Image corrupted by sinusoidal noise.
(b) Spectrum (each pair of conjugate impulses corresponds to one sine wave).
(Original image courtesy of NASA.)

- If amplitude strong enough, will see spectrum of each sine wave.

4

NOISE: PERIODIC NOISE

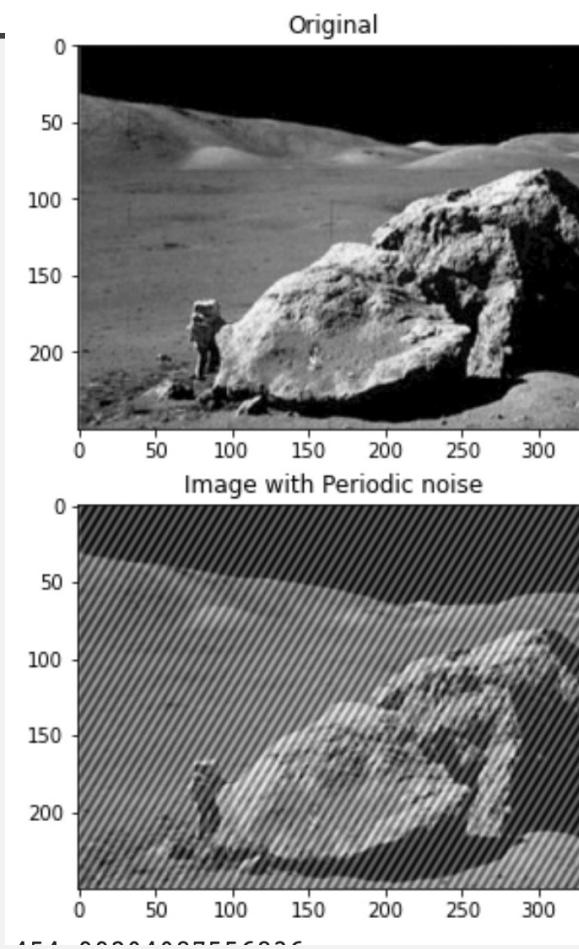

ສູນທະເຄ່ງ f ສູນທະເຄ່ງ $1/2 \rightarrow$ ຖະ 2π

```
img = cv2.imread("nasa_image.png", 0)

# strength
s = 100

nx, ny = img.shape
y = np.linspace(-nx/2, nx/2, nx)
x = np.linspace(-ny/2, ny/2, ny)
xv, yv = np.meshgrid(x, y) periodic noise
p = s * (np.sin(np.pi*xv/3+np.pi*yv/5)+1.0)
print(img.shape)

img_pn = img.astype(float)+p
```

4

EXERCISE #I NOISE: PERIODIC NOISE

- **Exercise #I:** use Fourier transform to investigate the “nasa_image.png” in frequency domain.

METHODS FOR RESTORATIONS

IMAGE RESTORATION

- ▶ Considering a noisy image $g(x,y)$ formed by the addition of noise $\eta(x,y)$ to an original image:

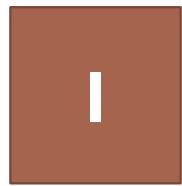

$$g(x, y) = f(x, y) + \eta(x, y)$$

- ▶ Frequency domain:

$$G(u, v) = F(u, v) + N(u, v)$$

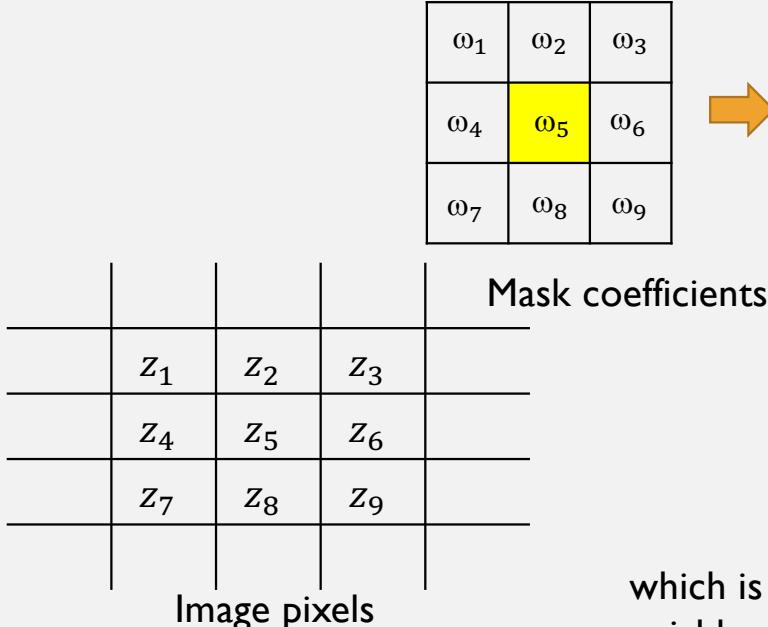

METHODS FOR RESTORATION

- Low-pass filtering/Averaging filtering
 - Cleaning Salt & Pepper and Gaussian filtering.
- Median filtering
 - Cleaning Salt & pepper noise.
- Removal of periodic noise.

LOW-PASS FILTERING/ AVERAGING FILTERING

► Averaging filters

box

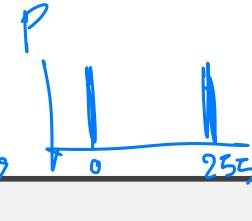

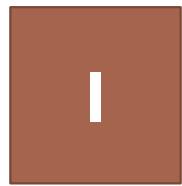

$$\frac{1}{9} \times \begin{array}{|c|c|c|} \hline 1 & 1 & 1 \\ \hline 1 & \textcolor{yellow}{1} & 1 \\ \hline 1 & 1 & 1 \\ \hline \end{array}$$

weight avg

$$\frac{1}{16} \times \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 2 & \textcolor{yellow}{4} & 2 \\ \hline 1 & 2 & 1 \\ \hline \end{array}$$

$$R = \sum_{i=1}^{mn} \omega_i z_i$$
$$R = \frac{1}{9} \sum_{i=1}^9 z_i$$

which is the average of the gray levels of the pixels in the 3×3 neighborhood
-A spatial averaging filter -> **box filter**
-the left mask (1/16) called **weighted average**

LOW-PASS FILTERING/ AVERAGING FILTERING

- Salt & Pepper – high-frequency components of an image. Low-pass filter (or averaging filter) should reduce S&P noise:

```
import cv2
from skimage.util import random_noise
import numpy as np

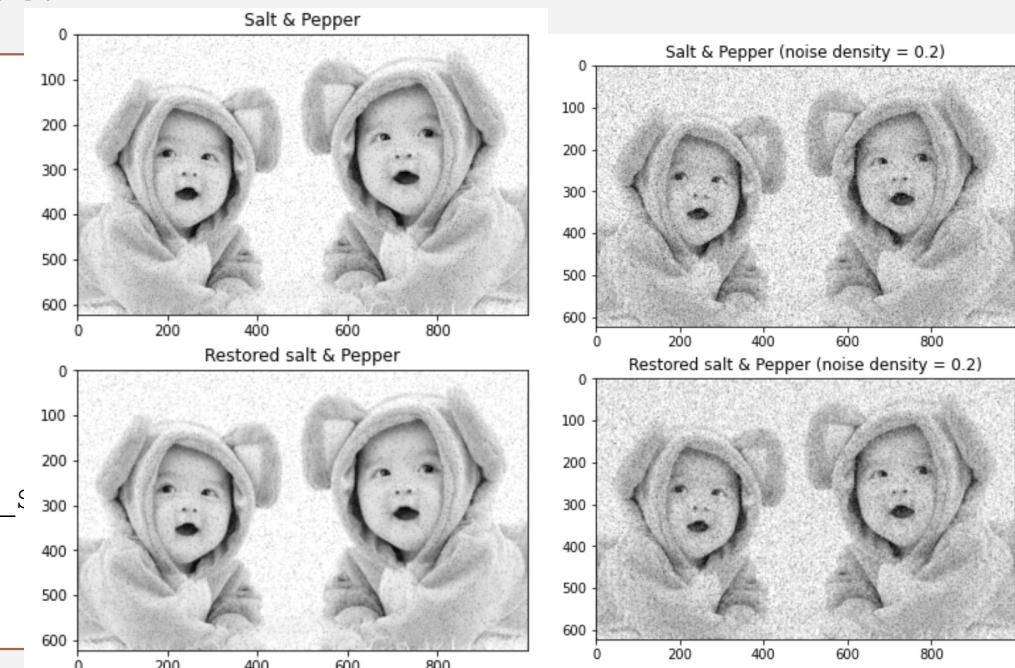

img = cv2.imread("twins.jpg", 0)

image_sp = random_noise(img, mode='s&p')
image_sp2 = random_noise(img, mode='s&p', amount = 0.2)

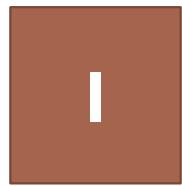

K_SIZE = 3

avg_filter = np.ones((K_SIZE,K_SIZE),np.float32)/(K_SIZE*K_SIZE)

image_sp_a3 = cv2.filter2D(image_sp, -1, avg_filter)
image_sp2_a3 = cv2.filter2D(image_sp2, -1, avg_filter)
```

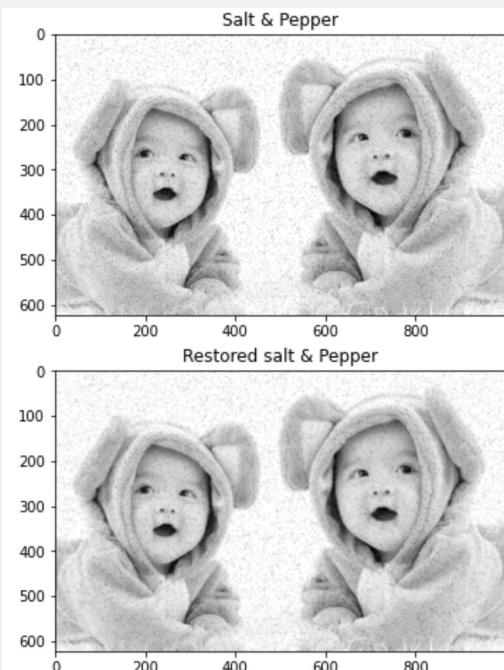

3x3 is so small to see differences!

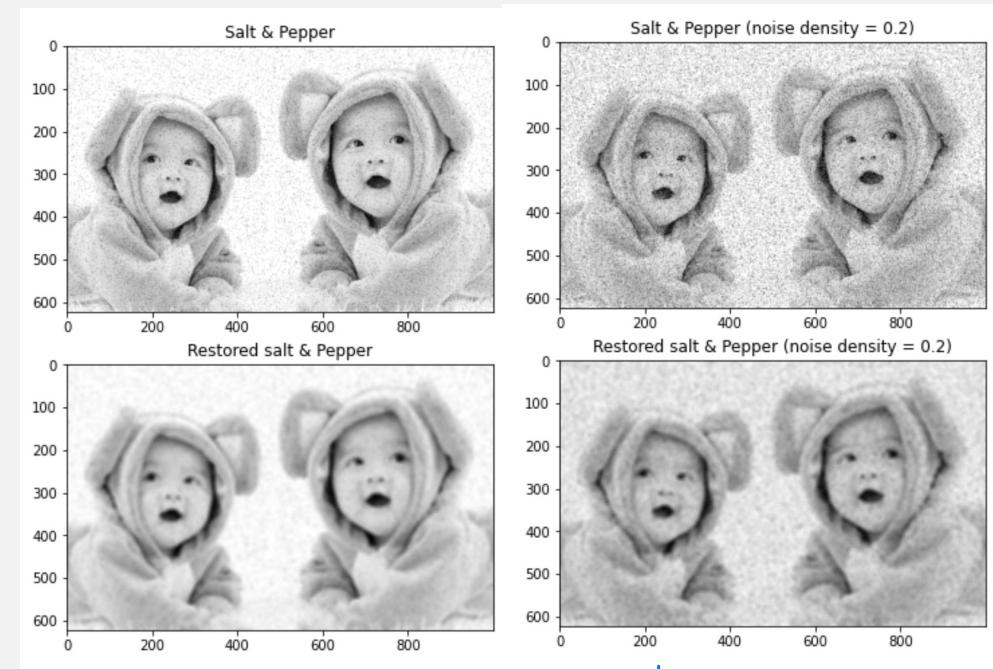

LOW-PASS FILTERING/ AVERAGING FILTERING

- With larger filter size:

3x3 Average filter

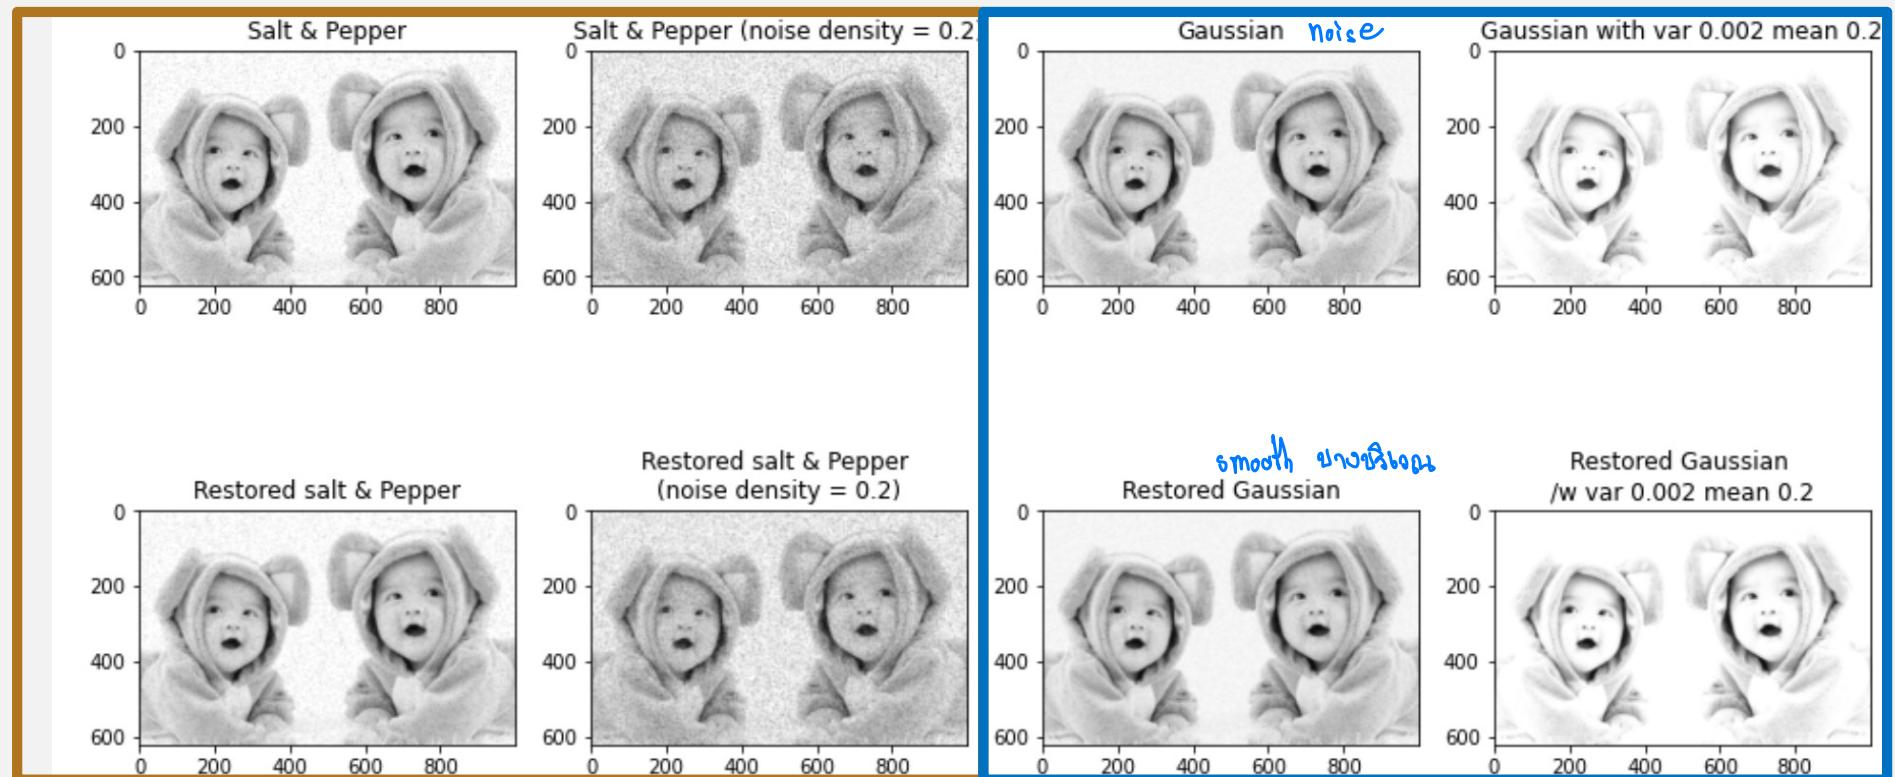

11x11 Average filter

noise noise
blur blur

I

LOW-PASS FILTERING/ AVERAGING FILTERING

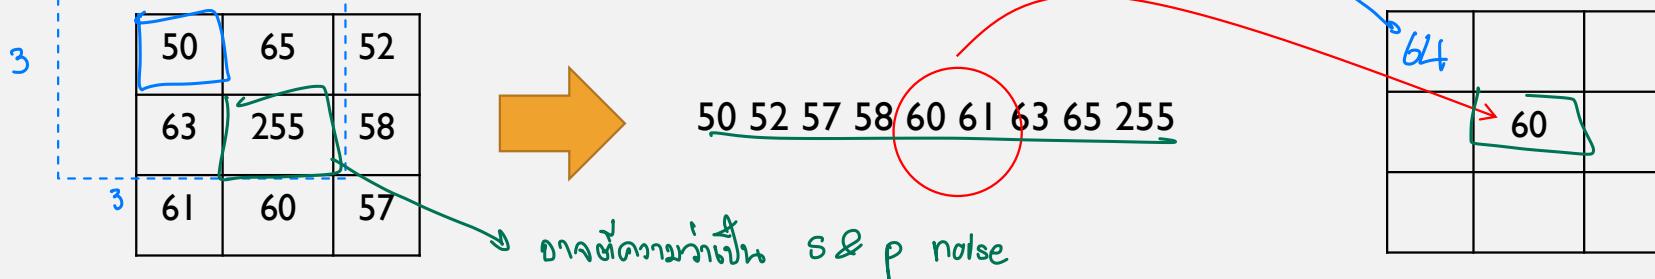

- Gaussian vs. Salt and Pepper noise

2

MEDIAN FILTERING

- Median values: 1 2 3 4 5 → 3
- Perform well when impulse noise is not large.

- What do you see from this example?
- Find the median values for the rest of the pixels.

2

MEDIAN FILTERING

- Python – **medianBlur()**

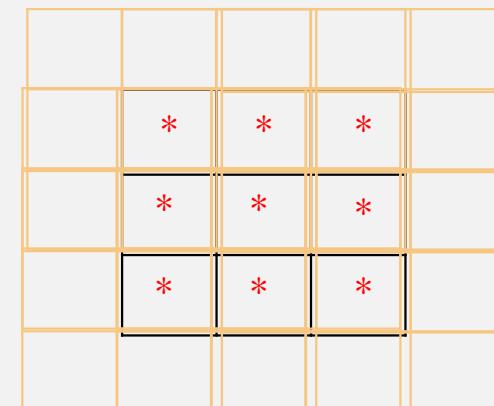

```
◆ medianBlur()
void cv::medianBlur ( InputArray src,
                     OutputArray dst,
                     int ksize
)
Python:
dst = cv.medianBlur( src, ksize[, dst] )

#include <opencv2/imgproc.hpp>
Blurs an image using the median filter.

The function smoothes an image using the median filter with the ksize × ksize aperture. Each channel of a multi-channel image is processed independently. In-place operation is supported.

Note
The median filter uses BORDER_REPLICATE internally to cope with border pixels, see BorderTypes

Parameters
src    input 1-, 3-, or 4-channel image; when ksize is 3 or 5, the image depth should be CV_8U, CV_16U, or CV_32F, for larger aperture sizes, it can only be CV_8U.
dst    destination array of the same size and type as src.
ksize  aperture linear size; it must be odd and greater than 1, for example: 3, 5, 7 ...
```

- **B = medianBlur(A, 3)** performs median filtering of the matrix A in two dimensions. Each output pixel contains the median value in a 3-by-3 neighborhood around the corresponding pixel in the input image using border replicate.

https://docs.opencv.org/master/d4/d86/group__imgproc__filter.html#ga564869aa33e58769b4469101aac458f9

2

MEDIAN FILTERING

```
from skimage import io, color
from skimage.util import random_noise
import cv2
import matplotlib.pyplot as plt

img = cv2.imread("twins.jpg",0)

image_sp = random_noise(img, mode='s&p')
image_sp2 = random_noise(img, mode='s&p')
image_sp = np.array(255*image_sp, dtype = 'uint8')
image_sp2 = np.array(255*image_sp2, dtype = 'uint8')

fig = plt.figure(figsize = (16,8))
fig.add_subplot(2,4,1), plt.imshow(image_sp, cmap="gray"), plt.title('Salt & Pepper')
fig.add_subplot(2,4,2), plt.imshow(image_sp2, cmap="gray"), plt.title('Salt & Pepper (noise desity = 0.2)')

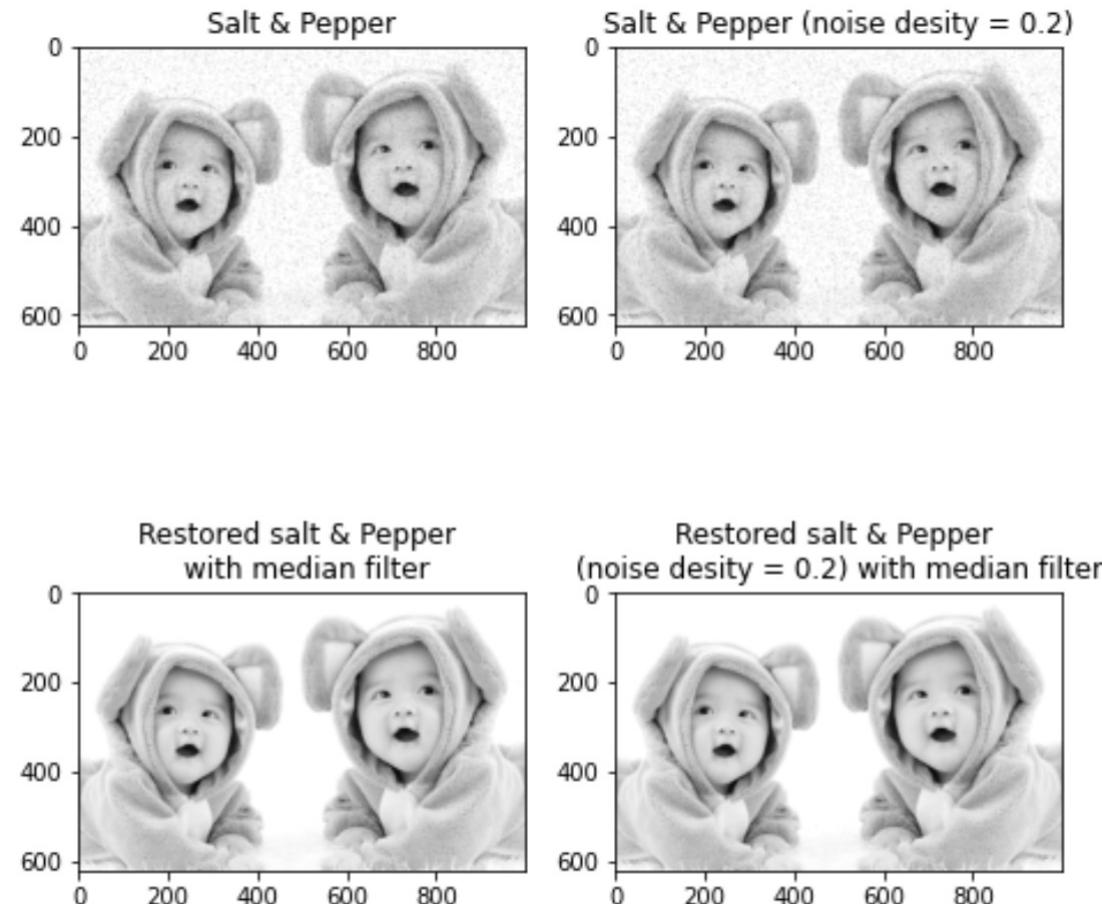

image_md = cv2.medianBlur(image_sp,3)
image_md2 = cv2.medianBlur(image_sp2,3)
fig.add_subplot(2,4,5), plt.imshow(image_md, cmap="gray"), plt.title('Restored salt & Pepper \n with median filter')
fig.add_subplot(2,4,6), plt.imshow(image_md2, cmap="gray"), plt.title('Restored salt & Pepper \n (noise desity = 0.2) with median filter')
plt.show()
```

3

MOVING PERIODIC NOISE

ລົງເຄຫດບ່ານຈຸດ

- A **notch filter** rejects (or passes) frequencies in predefined neighborhoods about a center frequency.
- Due to the symmetry of the Fourier transform, notch filters must appear in symmetric pairs about the origin in order to obtain meaningful results.
- So transfer function of an ideal notch filter (reject) of radius D_0 with a center at (u_0, v_0) and by symmetry at $(-u_0, -v_0)$:

ລົງເຄຫດບ່ານຈຸດ ນິກຕິດ + ກໍໂຄນດັງ

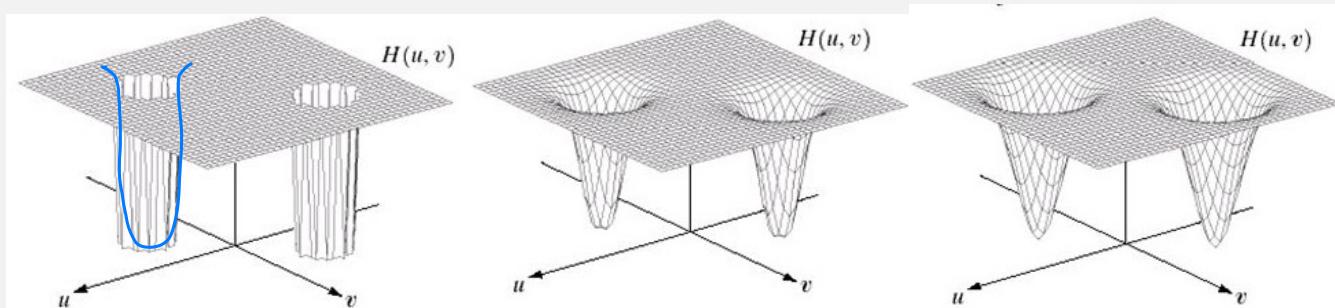

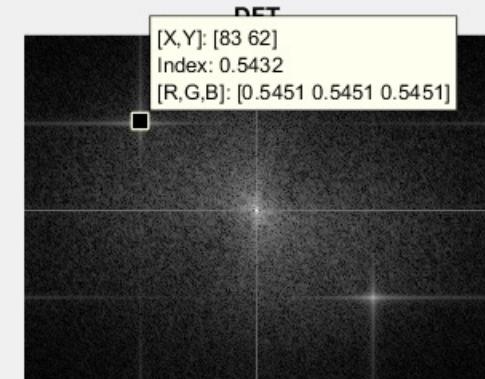

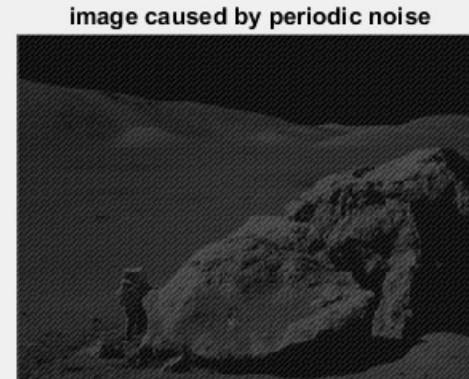

FIGURE 5.18 Perspective plots of (a) ideal, (b) Butterworth (of order 2), and (c) Gaussian notch (reject) filters.

3

REMOVING PERIODIC NOISE

- **Band Reject Filtering**

- Using check where the noise frequencies are.
- For band reject filtering -> create radius-angle coordinates to define the rejected band

3

EXERCISE #2: BAND REJECT FILTERING

```
nx, ny = img.shape
y = np.linspace(-nx/2,nx/2,nx)
x = np.linspace(-ny/2,ny/2,ny)
xv, yv = np.meshgrid(x,y)
radiusCoor = np.sqrt(xv**2 + yv**2)

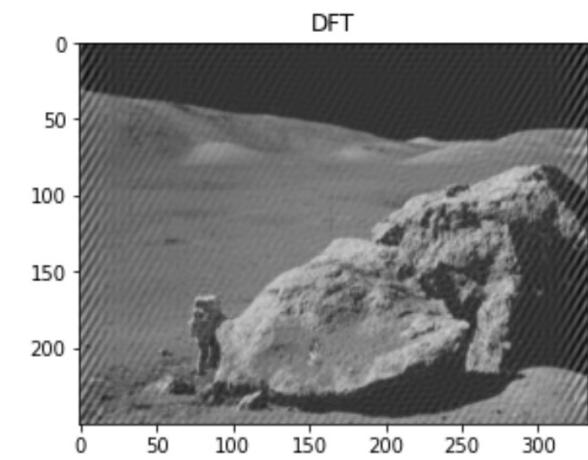

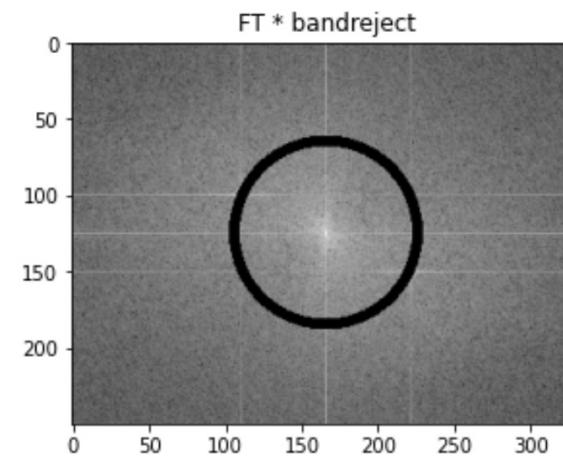

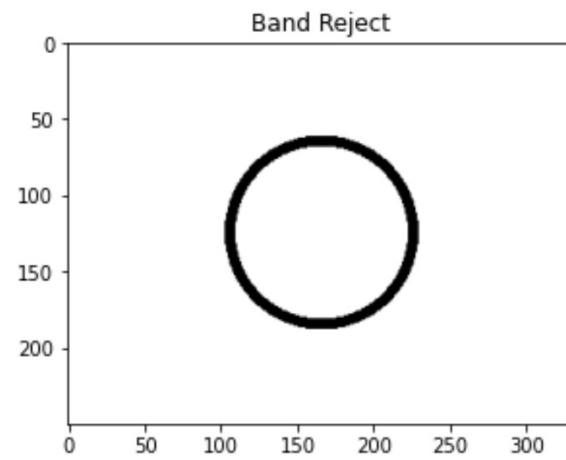

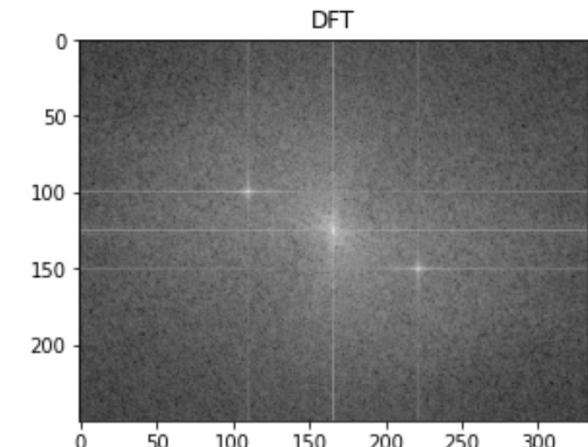

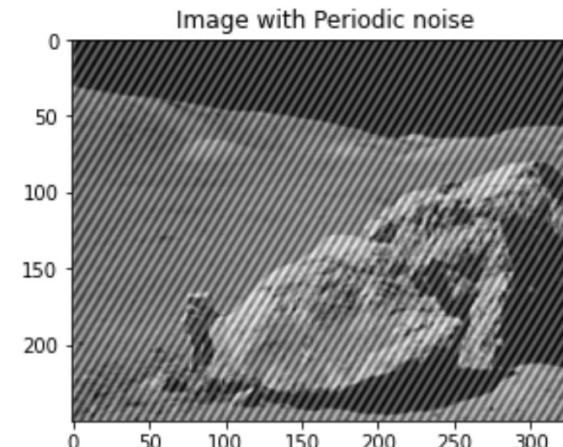

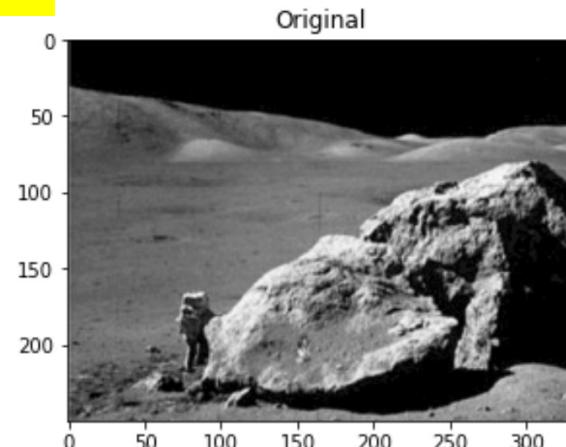

r1 = radiusCoor < _____
r2 = radiusCoor >= _____
mask1 = np.ones([nx,ny])
bandReject =
cv2.bitwise_or(r1.astype(np.uint8),r2.astype(np.uint8),mask=mask1.astype(np.uint8))
plt.imshow(bandReject,cmap='gray')
plt.show()

img_bandReject = bandReject * fshift
img_ft_filter_hp_spectrum = np.log(1+np.abs(img_bandReject))
plt.imshow(img_ft_filter_hp_spectrum)
plt.show()

f_ishift_br = np.fft.ifftshift(img_bandReject)
img_restored = np.fft.ifft2(f_ishift_br)
img_restored = np.abs(img_restored)
```

3

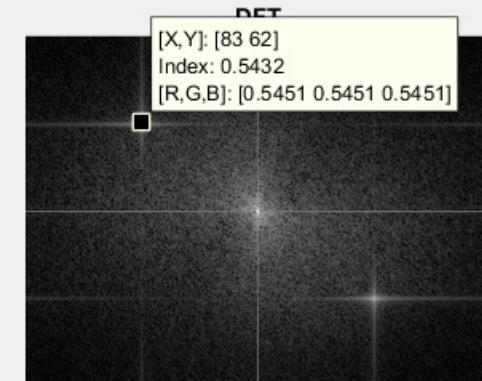

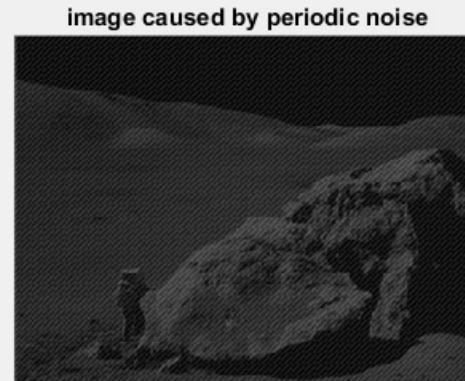

EXERCISE #2: BAND REJECT FILTERING

3

REMOVING PERIODIC NOISE

- Notch filter

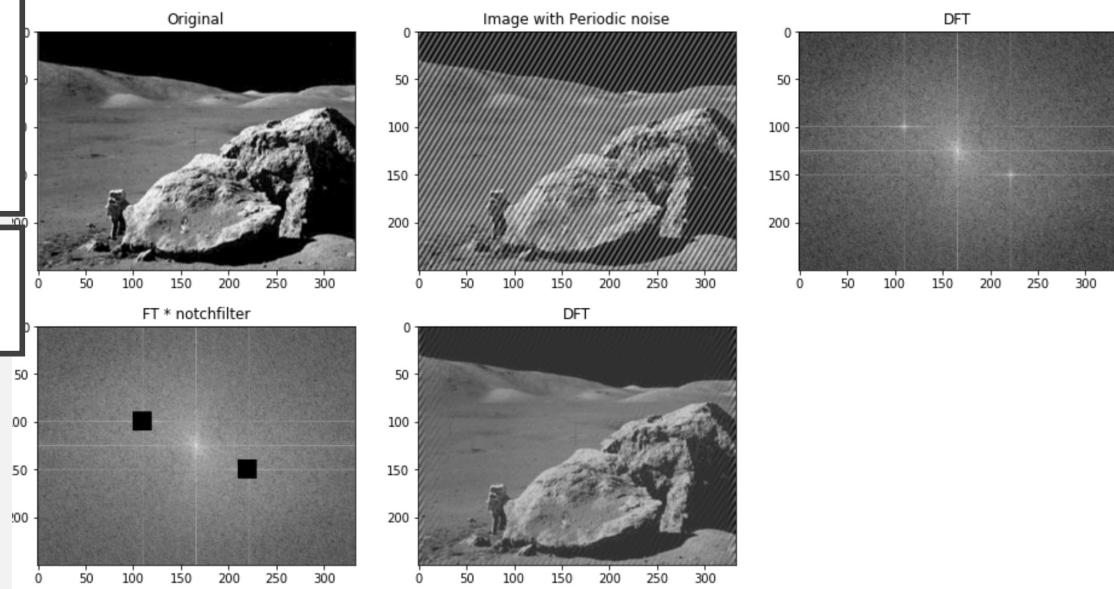

- Check where the noise frequencies are.
- For notch filter: we simply make rows and columns of the spikes 0.

3

PYTHON: NOTCH FILTERING

EXERCISE #3: NOTCH FILTERING

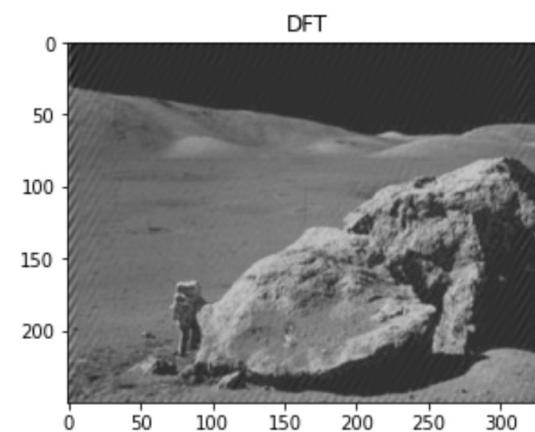

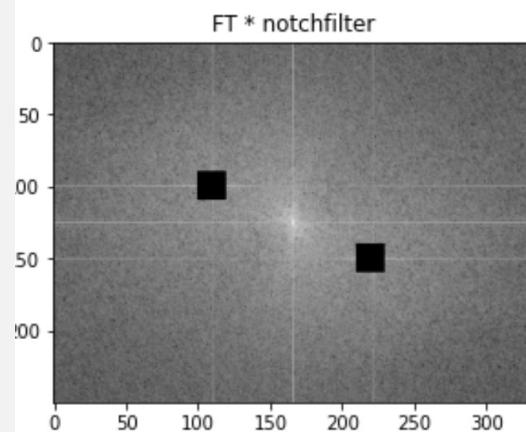

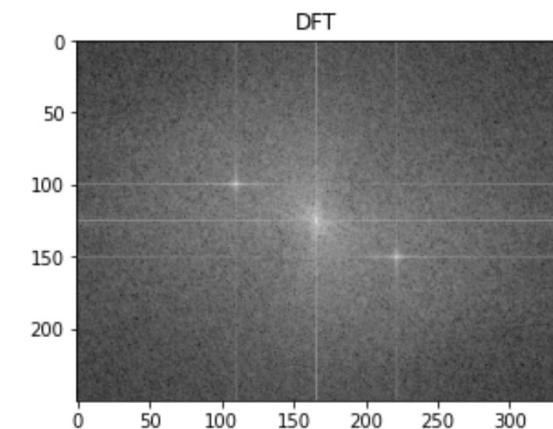

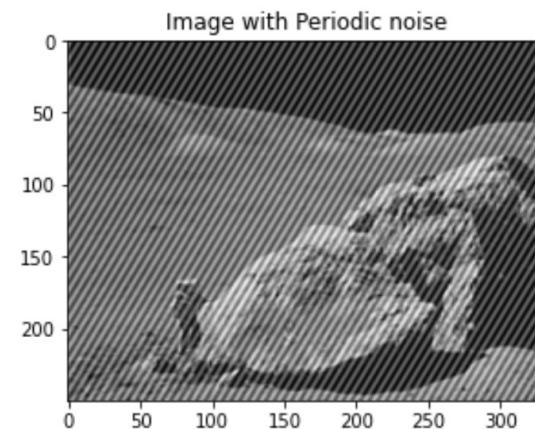

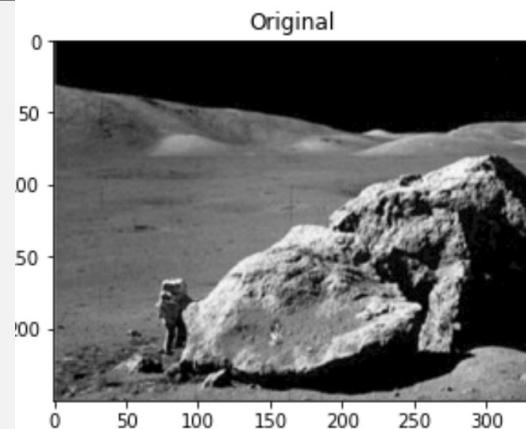

```
im_notchFilter = fshift.copy()
im_notchFilter[_____] = 0 #top left
im_notchFilter[_____] = 0 #bottom right

img_ft_filter_nf_spectrum = np.log(1+np.abs(im_notchFilter))

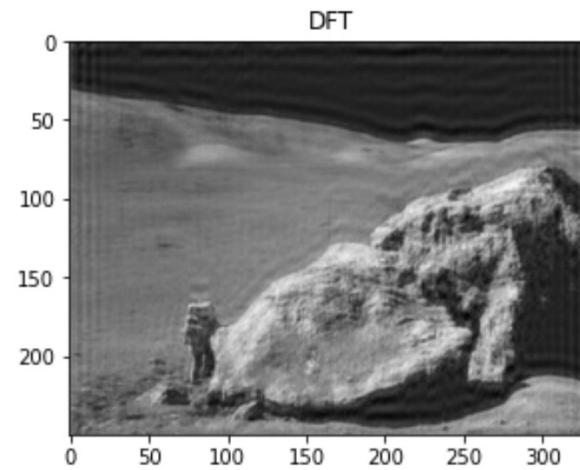

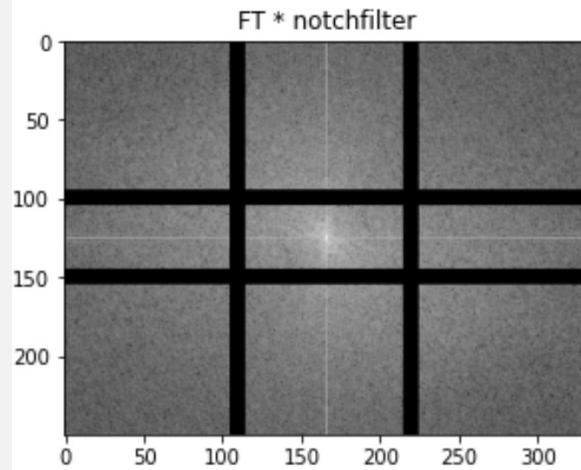

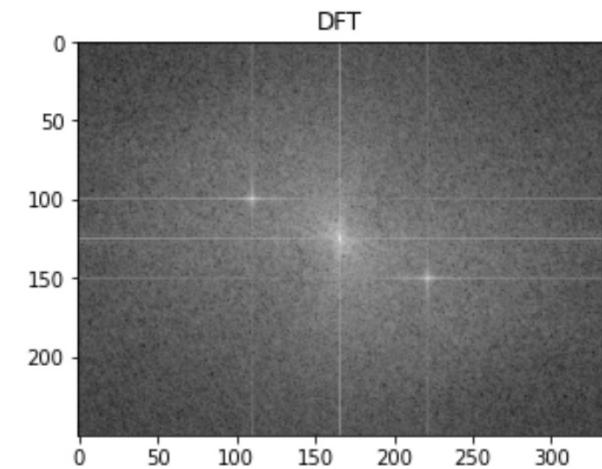

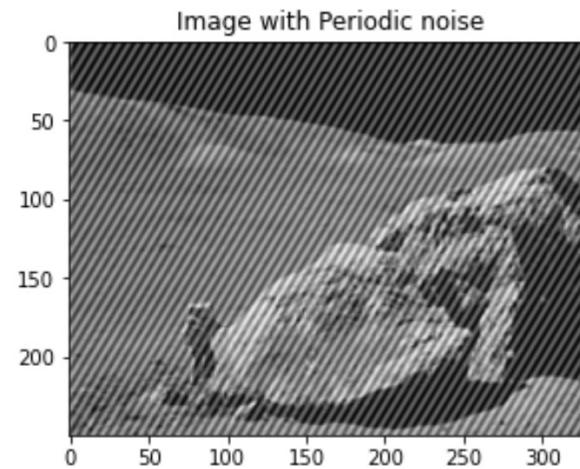

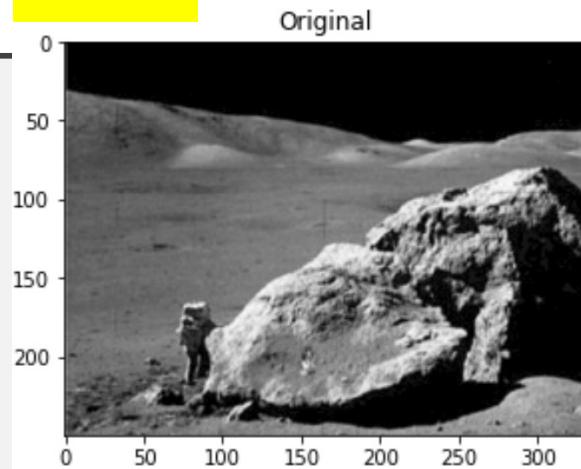

f_ishift_nf = np.fft.ifftshift(im_notchFilter)
img_restored = np.fft.ifft2(f_ishift_nf)
img_restored = np.abs(img_restored)
```

EXERCISE #3: NOTCH FILTERING

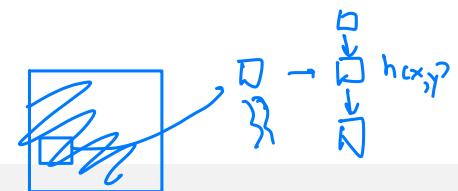

3

PYTHON: NOTCH FILTERING

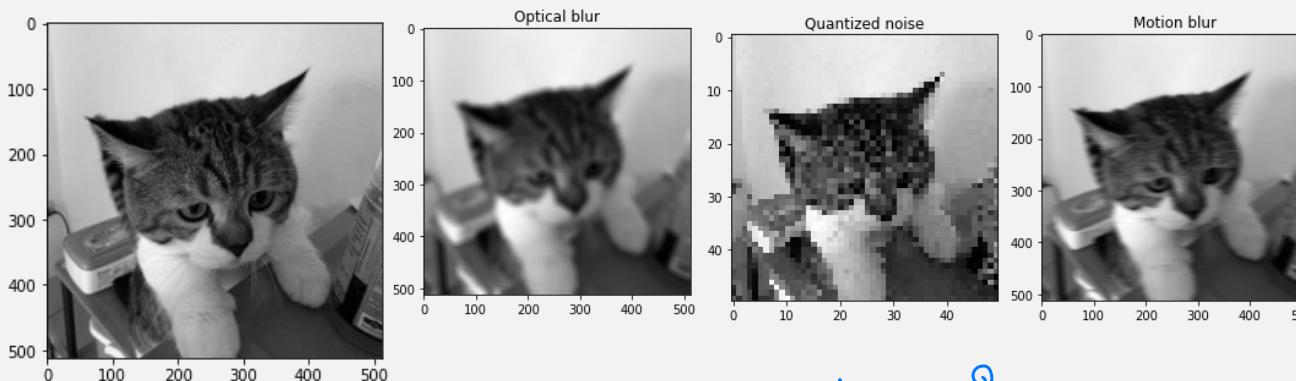

$$g(x,y) = f(x,y) * h(x,y) + \eta(x,y)$$

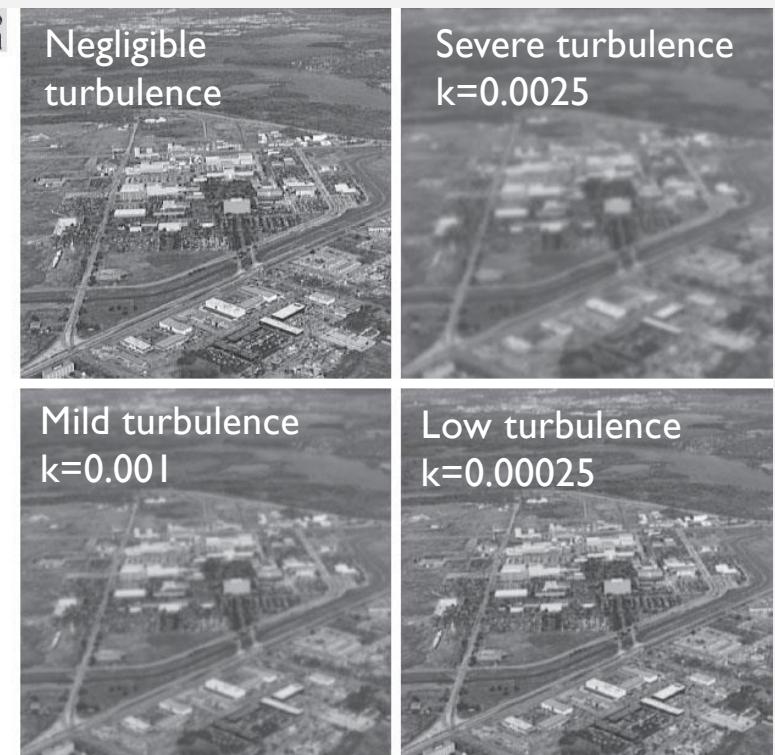

① ស្ថិត $h(x,y)$ (fn នៃ degrade នរណា គឺមីនា

OTHER DEGRADATIONS

- Estimating the degradation function
 - Estimation by Image observation សេចក្តកការការការ
 - Estimation by Experimentation $\frac{f(x,y)}{g(x,y)} = h(x,y)$ និង $h(x,y)$ មិនចងចាំពេញបែងប្រឈម
 - Estimation by Modelling
 - Atmosphere turbulence: Hufnagel and Stanley (1964)

$$H(u,v) = e^{-k(u^2+v^2)^{5/6}}$$

INVERSE FILTERING

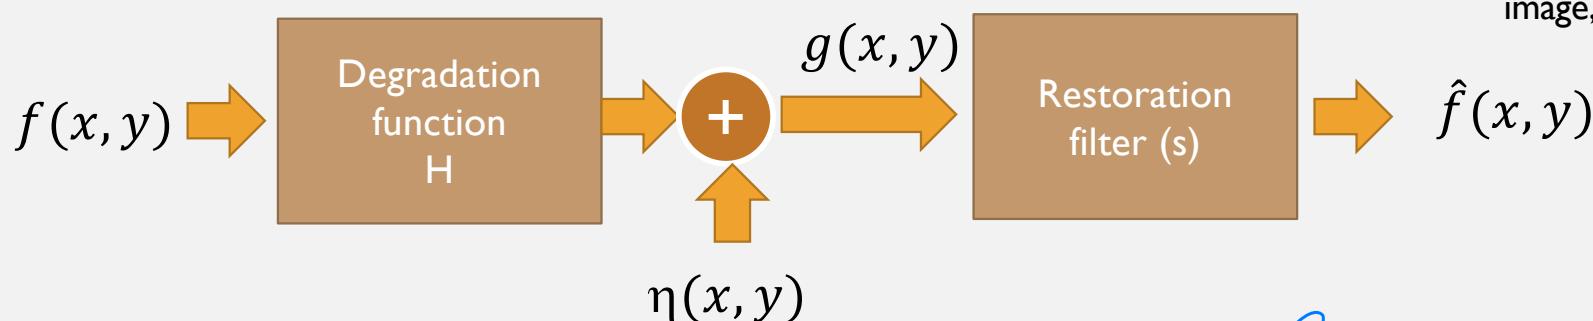

ພາກສານຕົ້ນຫອງໄວ

- An image degraded by a degradation function H and added by noise N can be represented in spatial domain and frequency domain below,

$$g(x, y) = h(x, y) * f(x, y) + \eta(x, y)$$

mnw degrade estimate

$$G(u, v) = H(u, v)F(u, v) + N(u, v)$$

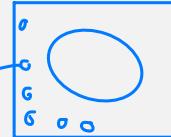

Spatial Domain
 $\eta(x, y)$ – noise term
 $f(x, y)$ – original image
 $g(x, y)$ – degraded image
 $\hat{f}(x, y)$ - reconstructed image
 N, F, G, \hat{F} are the frequency domain
of noise term, original image,
degraded image and reconstructed
image, respectively

$$\hat{F}(u, v) = \frac{G(u, v)}{H(u, v)}$$

INVERSE FILTERING

- An image degraded by a degradation function H . The simplest approach to restoration is direct inverse filtering, where we compute an estimate, $\hat{F}(u, v)$ by

$$\hat{F}(u, v) = \frac{G(u, v)}{H(u, v)}$$

H ~~is~~ *degrad* *G*

- If there is noise term, we get

$$\hat{F}(u, v) = F(u, v) + \frac{N(u, v)}{H(u, v)}$$

Introduction to Inverse Problems in Imaging,
M. Bertero, P. Boccacci, Christine De Mol
(2021)

N, F, G, \hat{F} are the frequency domain of noise term, original image, degraded image and reconstructed image, respectively.

4 MINIMUM MEAN SQUARE ERROR (WIENER) FILTERING

- Wiener filter is to find the reconstructed image $\hat{f}(x, y)$ that minimizing the mean square error of $\hat{f}(x, y)$ and $f(x, y)$ by

$$e^2 = E\{(f - \hat{f})^2\}$$

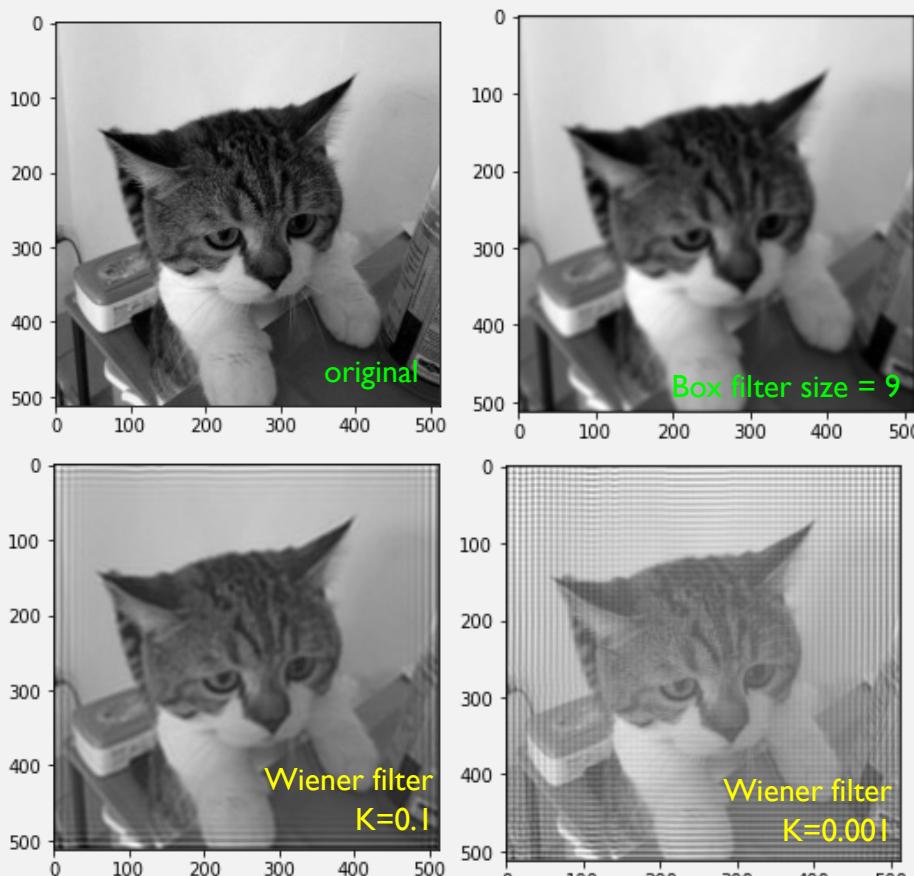

- where $E\{\cdot\}$ is the expected value of the argument. Based on this conditions, the minimum error is given in the frequency domain by the expression

$$\hat{F}(u, v) = \left[\frac{H^*(u, v)}{|H(u, v)|^2 + S_\eta(u, v)/S_f(u, v)} \right] G(u, v)$$

Constant K

$H(u, v)$ -degradation function
 $H^*(u, v)$ -complex conjugate of $H(u, v)$
 $|H(u, v)|^2 = H^*(u, v) H(u, v)$
 $S_\eta(u, v) = |N(u, v)|^2$ - power spectrum of the noise
 $S_f(u, v) = |F(u, v)|^2$ - power spectrum of the undegraded image

4 MINIMUM MEAN SQUARE ERROR (WIENER) FILTERING

wiener

```
skimage.restoration.wiener(image, psf, balance, reg=None, is_real=True, clip=True)  
[source]
```

Wiener-Hunt deconvolution

Return the deconvolution with a Wiener-Hunt approach (i.e. with Fourier diagonalisation).

Parameters

image : (M, N) ndarray

Input degraded image

psf : ndarray

Point Spread Function. This is assumed to be the impulse response (input image space) if the data-type is real, or the transfer function (Fourier space) if the data-type is complex. There is no constraints on the shape of the impulse response. The transfer function must be of shape (M, N) if *is_real* is True, (M, N // 2 + 1) otherwise (see *np.fft.rfftn*).

balance : float

The regularisation parameter value that tunes the balance between the data adequacy that improve frequency restoration and the prior adequacy that reduce frequency restoration (to avoid noise artifacts).

Returns

im_deconv : (M, N) ndarray

The deconvolved image.

François Orieux, Jean-François Giovannelli, and Thomas Rodet, “Bayesian estimation of regularization and point spread function parameters for Wiener-Hunt deconvolution”, J. Opt. Soc. Am. A 27, 1593-1607 (2010) <https://www.osapublishing.org/josaa/abstract.cfm?URI=josaa-27-7-1593>

RESTORATION: EVALUATION

Peak signal-to-noise ratio (PSNR) is the ratio between the maximum possible power of an image and the power of corrupting noise that affects the quality of its representation. To estimate the PSNR of an image, it is necessary to compare that image to an ideal clean image with the maximum possible power.

PSNR is defined as follows:

$$PSNR = 10 \log_{10} \left(\frac{(L-1)^2}{MSE} \right) = 20 \log_{10} \left(\frac{L-1}{RMSE} \right)$$

maximum intensity $\approx L=256$

PSNR ค่าสูงมาก

Here, L is the number of maximum possible intensity levels (minimum intensity level suppose to be 0) in an image.

MSE is the mean squared error & it is defined as:

$$MSE = \frac{1}{mn} \sum_{i=0}^{m-1} \sum_{j=0}^{n-1} (O(i, j) - D(i, j))^2$$

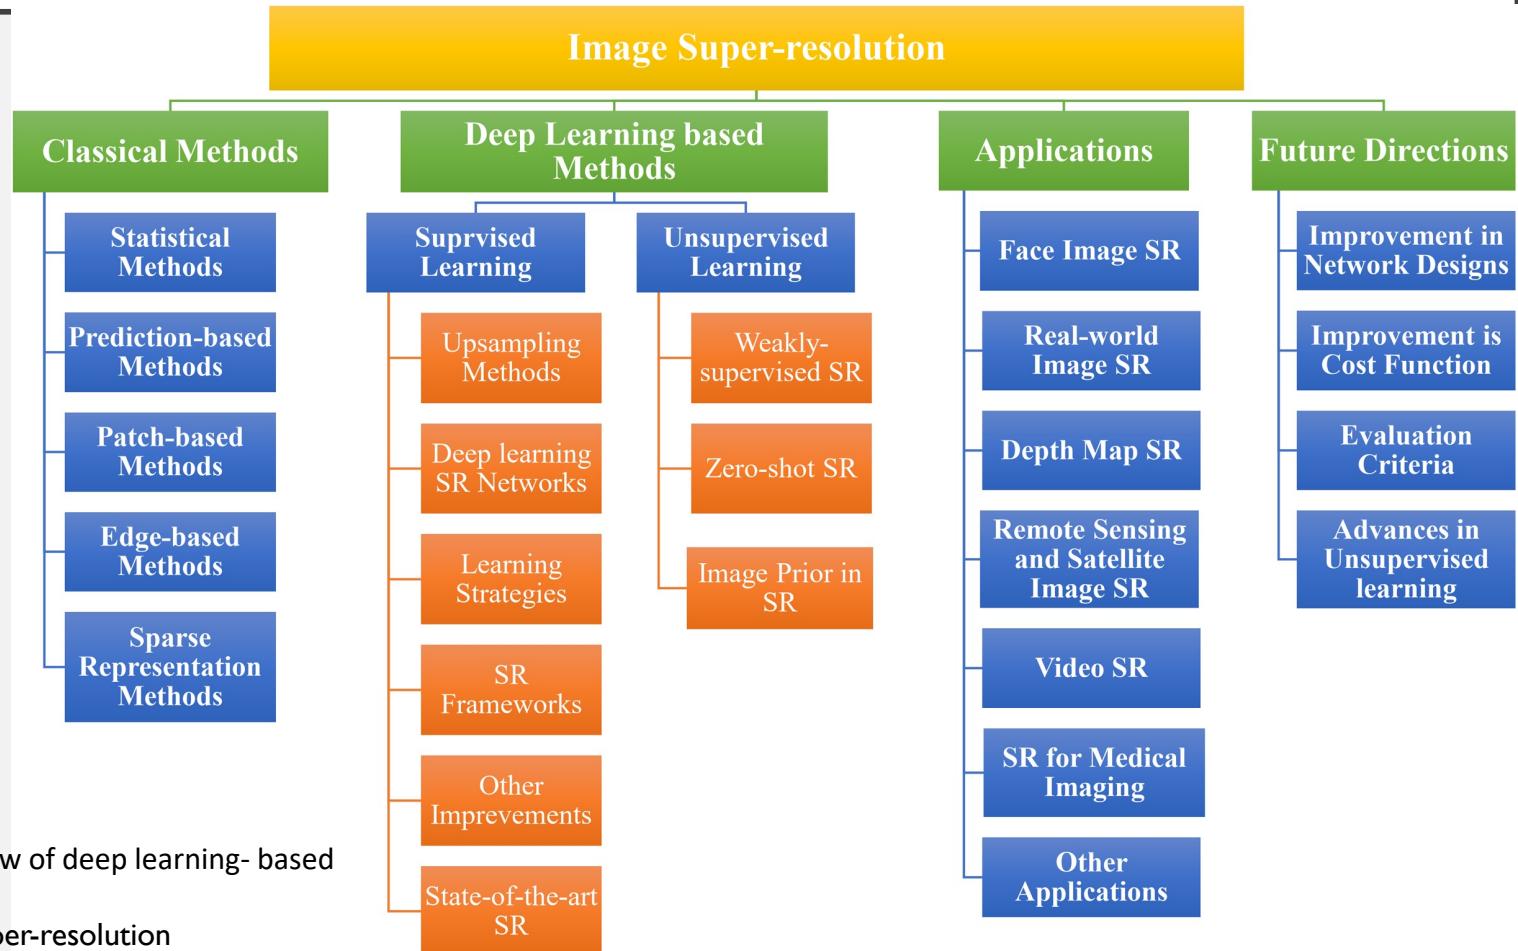

$(F - \hat{F})^2 \approx 0$ estimate

- Other metrics
 - Structural Similarity Index (SSIM)

IMAGE SUPERRESOLUTION

- Image super-resolution (SR) is one of the vital image processing methods that improve the resolution of an image in the field of computer vision

S.M.A. Bashir, et al. A comprehensive review of deep learning- based single image super-resolution (2021)
<https://paperswithcode.com/task/image-super-resolution>
